[\[Next\]](#) [\[Previous\]](#) [\[Bookmarks\]](#) [\[Top\]](#)

Application: All programs

[\[Next\]](#) [\[Previous\]](#) [\[Bookmarks\]](#) [\[Top\]](#)

Description: This Operation is based on the soil moisture accounting portion of the Sacramento Model [Burnash et. al., 1973].

A complete description of this Operation is in Chapter II.3-SAC-SMA [\[Hyperlink\]](#).

In addition to the basic soil moisture accounting model the following provisions are included in this Operation:

1. If an areal extent of snow time series is used then the

evapotranspiration (ET) demand is reduced by the following equation when snow is on the ground:

$$Es = EFC * Ed + (1.0 - EFC) * (1.0 - Sc) * Ed$$

where Es is the ET-demand with snow on the ground

Ed is the ET-demand without snow on the ground

EFC is the effective forest cover parameter

Sc is the areal extent of snow cover expressed as

2. The ET-demand can be uniform throughout the day or can have a fixed diurnal variation. It is recommended that in most cases the uniform ET-demand rate be used. The use of a diurnally varying ET-demand rate, though more physically realistic, will not result in the correct loss of water due to evapotranspiration from riparian vegetation. The fixed diurnal ET-demand variation expressed as percent/100 of daily ET-demand that is applied each hour is as follows:

<u>Hour (local time)</u>	<u>Portion of ET-demand</u>
1-8	0.00
9	0.02
10	0.05
11	0.10
12	0.16
13	0.20
14	0.18
15	0.14
16	0.09
17	0.05
18	0.01
19-24	0.00

2. A precipitation multiplying factor is provided for possible use during an operational program run. This precipitation multiplier is only applied during the computational period (i.e., period with observed data).

Allowable Data Time Intervals: 1, 2, 3, 4, 6, 8, 12 and 24 hours

Time Series Used: Time series used in this Operation are as follows:

<u>General Type</u>	<u>Dimn</u>	<u>Units</u>	<u>Use</u>	<u>Required</u>	<u>Form of Output</u>	<u>Data Time</u>	<u>Missing Values</u>
					<u>T.S.</u>	<u>Interval</u>	<u>Allowed</u>
Precipitation (rain + melt)	L	MM	I	yes	n/a	any	no
Channel inflow (runoff)	L	MM	O	yes	replaces	any <u>1/</u>	no
Potential ET	L	MM	I	no	n/a	24	no
Areal extent of snow	DLES	PCTD	I	no	n/a	any <u>2/</u>	no
Runoff components (data type code ROCL) <u>3/</u>	L	MM	O	no	replaces	any <u>2/</u>	no
Soil moisture storages (data type code SMZC) <u>4/</u>	L	MM	O	no	replaces	any <u>2/</u>	no

Notes:

- 1/ Must be the same as the time interval for rain plus melt data.
- 2/ Must be a multiple of the time interval for rain plus melt data.
- 3/ The 7 runoff components (ROCL) data values per time interval are:
 - (1) total channel inflow
 - (2) impervious runoff
 - (3) direct runoff
 - (4) surface runoff
 - (5) interflow
 - (6) supplemental baseflow
 - (7) primary baseflow
- 4/ The 5 soil moisture storages (SMZC) data values per time interval are:
 - (1) upper zone tension water deficit (UZTWM-UZTWC)
 - (2) upper zone free water contents (UZFBC)
 - (3) lower zone tension water deficit (LZTWM-LZTWC)
 - (4) lower zone free supplemental contents (LZFSC)
 - (5) lower zone free primary contents (LZFPC)

Input Summary: The card input for this Operation is as follows:

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
1	5A4	1-20	General heading information
	8X, I2	29-30	Data time interval of precipitation (rain plus melt) and channel inflow data
	2X, 2A4	33-40	Internal identifier for the precipitation (rain plus melt) time series
	1X, A4	42-45	Data type code for precipitation time series
	7X, 2A4	53-60	Identifier for the channel inflow (runoff) time series
	1X, A4	62-65	Data type code for runoff time series
2	2X, 2A4	3-10	Identifier for areal extent of snow time series; blank if none
	1X, A4	12-15	Data type code for areal extent of snow time series (blank if not used)
	3X, I2	19-20	Data time interval of areal extent of snow cover time series (blank if not used)
	2X, 2A4	23-30	Identifier for runoff components time series; data type code is 'ROCL'; blank if none
	2X, 2A4	33-40	Identifier for soil moisture storage time series; data type code is 'SMZC'; blank if none
	1X, A4	42-45	Option to store sums of water balance, runoff and evapotranspiration (ET) components for execution period (default is to not store sums); enter 'SUMS' if sums are to be stored
	1X, A4	47-50	Enter 'PRST' to print detailed soil moisture output (blank otherwise); this option is used when running Calibration System program (MCP3 or OPT3) and the months to print are controlled by card 7; if running the Operational Forecast System program FCST use the Technique PRINTSMA to set this option
	3X, I2	54-55	Data time interval of the runoff

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
			components time series (default is 24 hours)
	3X,I2	59-60	Data time interval of the soil moisture storage time series (default is 24 hours)
	1X,A4	62-65	Enter 'FRZE' to use the frozen ground portion of the Sacramento Model; this option is used when running Calibration System program (MCP3 or OPT3); if running the Operational Forecast System program FCST use the Technique FROST to set this option
3	20X,F5.2	21-25	PXADJ (precipitation adjustment factor); this factor may have been applied in a preceding snow model Operation
	F5.2	26-30	PEADJ (ET-demand adjustment factor)
	F5.0	31-35	UZTWM (upper zone tension water capacity; units of MM)
	F5.0	36-40	UZFWM (upper zone free water capacity; units of MM)
	F5.2	41-45	UZK (fractional daily upper zone free water withdrawal rate)
	F5.2	46-50	PCTIM (minimum impervious area; units of percent/100)
	F5.2	51-55	ADIMP (additional impervious area; units of percent/100)
	F5.2	56-60	RIVA (riparian vegetation area; units of percent/100)
	I5	61-65	Diurnal evapotranspiration (ET) variation option (default is uniform distribution of daily ET-demand); enter value greater than zero to use diurnal variation (it is recommended that the default option be generally used)
	F5.2	66-70	EFC (effective forest cover; units of percent/100)
4	20X,F5.1	21-25	ZPERC (PBASE*(1+ZPERC) is the maximum percolation rate)
	F5.1	26-30	REXP (exponent for the percolation

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
			equation)
F5.0	31-35	LZTWM (lower zone tension water capacity; units of MM)	
F5.0	36-40	LZFPM (lower zone supplemental free water capacity; units of MM)	
F5.0	41-45	LZFPN (lower zone primary free water capacity; units of MM)	
			Note: LZFSM and LZFPN are input as total values and not just as the visible (channel component) portion
F5.2	46-50	LZSK (fractional daily supplemental withdrawal rate)	
F5.2	51-55	LZPK (fractional daily primary withdrawal rate)	
F5.2	6-60	PFREE (percent/100 of percolated water which always goes directly to lower zone free water storages)	
F5.2	61-65	RSERV (percent/100 of lower zone free water which cannot be transferred to lower zone tension water)	
F5.2	66-70	SIDE (ratio of non-channel baseflow (deep recharge) to channel (visible) baseflow)	
5	2X,2A4	3-10	Identifier for potential evapotranspiration (ET) time series (blank if none used)
	1X,A4	12-15	Data type code for potential evapotranspiration (ET) time series (blank if none used)
5X,12F4.2	21-68	ET-demand or PE-adjustment factor for the 16th of each month (January through December; units of MM/day); daily values are computed by linear interpolation; if PE data used then values are PE-adjustments; if PE data not used then values represent ET-demand	
6			Initial carryover values for the state variables:
20X,F5.0	21-25	UZTWC (upper zone tension water	

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
			contents; units of MM)
F5.0	26-30		UZFWC (upper zone free water contents; units of MM)
F5.0	31-35		LZTWC (lower zone tension water contents; units of MM)
F5.0	36-40		LZFSC (lower zone free supplemental contents; units of MM)
F5.0	41-45		LZFPC (lower zone free primary contents; units of MM)
F5.0	6-50		ADIMC (tension water contents of the ADIMP area; units of MM; if not known then use UZTWC+LZTWC)
4X,I1	55		Read additional carryover indicator: 0 = set additional carryover to default values 1 = read additional carryover

Card 6A needed only if read additional carryover indicator (column 55 of Card 6) is set to one and either PE, snow cover or runoff component time series are used.

6A	7F5.0	1-35	Current values of runoff components time series; see Note 3/ under Time Series Used
	5X,F5.0	41-45	Previous PE value
	F5.0	46-50	Previous snow cover value

Card 7 needed only if this is a Calibration System program (MCP3 or OPT3) and detailed output was requested on Card 2.

7	14I5	1-70	Months for which detailed output is to be printed; form of input is month, year, month, year, etc.; years are 4 digits; months must be in chronological order; maximum of 7 months can be entered
---	------	------	---

Cards F1, F2 and F3 are needed only if 'FRZE' was specified in columns 62-65 of Card 2. 1/ 2/ 3/

F1	2X,A8	3-10	Identifier of air temperature time series
	1X,A4	12-15	Data type code of air temperature time series

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
	3X,I2	19-20	Data time interval of air temperature time series
	17X,A8	38-45	Identifier of water equivalent time series; blank if none
	1X,A4	47-50	Data type code of water equivalent time series
	3X,I2	54-55	Data time interval of water equivalent time series
	2X,A8	58-65	Identifier of frost index time series; blank if none; data type code is set to 'FGIX'
	3X,I2	69-70	Data time interval of frost index time series
F2			Frozen ground model parameters (symbols in brackets are those used in the reference 'Inclusion of Frozen Ground Effects in a Flood Forecasting Model'):
	F5.0	1-5	CSOIL (units of DEGC ⁻¹ *HR ⁻¹) [Cg]; bare ground frost coefficient for a given time interval
	F5.0	6-10	CSNOW [Cs]; reduction in CSOIL per MM of snow water equivalent
	F5.0	11-15	GCH (units of DEGC/DAY) [Hc]; daily thaw rate from ground head
	F5.0	16-20	RTHAW (units of DEGC/MM) [Ct]; thaw coefficient for water entering the soil
	F5.0	21-25	FRTEMP (units of DEGC) [FI1]; FI value above which there is no reduction in percolation or interflow withdrawal
	F5.0	26-30	SATR (units of DEGC ⁻¹ *HR ⁻¹) [Cr]; reduction in percolation and interflow withdrawal per DEGC of FI below FI1 under saturated soil conditions
	F5.0	30-35	FREXP [x]; exponent
F3	F5.0	1-5	FINDX (units of DEGC) [FI]; initial value of the frost index (if starting with no frozen ground the value is zero)
	F5.0	31-35	PTA (units of DEGC) [Ta]; initial value

<u>Card</u>	<u>Format</u>	<u>Columns</u>	<u>Contents</u>
			of the air temperature

F5.0 36-40 PWE (units of MM) [W]; initial value of
the snow water equivalent

Notes:

- 1/ Parameter and state variable names are not printed as part of the Operation summary. The parameters are identified as FGPARM(1), FGPARM(2), etc. The parameter values are printed in the same order that they are input.
- 2/ When using the Interactive Calibration Program (ICP) the parameter values must be changed using the Edit Deck menu option. They cannot be changed using the Selected Parameters option.
- 3/ If the parameter SATR is set to zero the frost index can be computed and displayed as part of the SAC-SMA model panel in ICP but the frozen ground algorithms will not change the percolation or interflow withdrawal rates in the model. This is a way to see whether the frost index should be used to modify the Sacramento Model computations. Values of SATR that are greater than zero cause the percolation in interflow withdrawal rates to decrease whenever the frost index drops below the value of the FRTEMP parameter.

Sample Input and Output: Sample input is shown in Figure 1 [\[Bookmark\]](#). Sample output from the print parameter and print carryover routines is shown in Figure 2 [\[Bookmark\]](#). Sample output from the execution routine is shown in Figure 3 [\[Bookmark\]](#).

[\[Next\]](#) [\[Previous\]](#) [\[Bookmarks\]](#) [\[Top\]](#)

Error and Warning Messages: The error and warning messages generated by this Operation and the corrective action to take when they occur are as follows:

A. Messages that can occur during setup.

1. **ERROR** TIME INTERVAL=nn ONLY IN INTERVALS OF 1, 2, 3, 4, 6, 8, 12 AND 24 HOURS ARE ALLOWED.

Action: Use an allowable computational time interval.

2. **WARNING** NOTE THAT PXADJ MAY HAVE ALREADY BEEN APPLIED BY A SNOW MODEL OPERATION.

Action: Make sure that PXADJ has not been applied twice.

3. **WARNING** nn PARAMETERS WERE CHANGED BECAUSE THEY WERE ASSIGNED IMPOSSIBLE VALUES.

Action: Check that revised values are okay.

B. Messages that can occur during execution.

1. **WARNING** INITIAL STATE VARIABLES CONTAIN IMPOSSIBLE VALUES.

Action: Check the revised values.

2. **WARNING** WATER BALANCE RESIDUAL EXCEEDS 1 MM.
RESIDUAL=nnnn.

Action: Operation is not executing properly.

[\[Next\]](#) [\[Previous\]](#) [\[Bookmarks\]](#) [\[Top\]](#)

Carryover Transfer Rules: The following rules apply to the 6 state variables during the carryover transfer process:

1. UZTWC and LZTWC: the deficit (i.e., capacity-contents) is retained as long as the contents do not go below zero
2. UZFWM: value remains the same as long as UZFWM is less than or equal to UZFWC
3. LZFSC and LZFPC: the channel component of the withdrawal from these storages remain the same as long as the contents are less than or equal to the capacities. The equation used is:

$$LZFSC_n = LZFSC_o * (LZSKo / LZSKn) * ((1 + SIDE_n) / (1 + SIDE_o))$$

where the subscripts n and o signify new and old values, respectively. A similar equation is used for LZFPC.

4. ADIMC: the deficit (i.e., UZTWM+LZTWM-ADIMC) is retained as long as ADIMC is greater than or equal to UZTWC
